

CAM2 hearing aid fitting software

CAM2 software is a package that enables hearing aids to be tailored to an individual's needs, resulting in improved hearing quality.

All modern hearing aids include multi-channel amplitude compression and the characteristics of the compression need to be set to suit the individual hearing-impaired person. CAM2 has been developed to provide a superior solution for the tailoring of wide-band hearing aid parameters using the audiogram alone, and is an essential new tool in the audiology field.

CAM2 is available for licensing to hearing aid manufacturers and providers and for academic research purposes. If you are a hearing aid user interested in having CAM2 software used in the fitting of your hearing aid, please contact your hearing aid provider and ask them to get in touch with us directly.
